COMPLETE SPECIFICATION

Piperazine Derivatives and preparation thereof

I, ROLAND-YVES MAUVERNAY, a French citizen of 63 Riom, France, do hereby declare the invention for which I pray that a patent may be granted to me, and the method by which it is to be performed to be particularly described in and by the following state-

ment:—
The present invention is concerned with a novel class of piperazine derivatives and with a process for their preparation.

I have mound that piperazine derivatives of the formula

in which R₁ is a phenyl, 4-fluorophenyl, 3,4,5 - trimethoxyphenyl, furyl, thienyl, 3 pyridyl or 4 - pyridyl group; R₂ is a phenyl, 4 - chlorophenyl, 2 - fluorophenyl, 4 - fluorophenyl, a phenyl - alkoxyethyl group of the formula

(in which R is an alkyl group containing 1 to 4 carbon atoms, particularly methyl, ethyl or isobutyl), or a benzyl group; and n is 1, 2 or 3, and their addition salts with physio-25 logically acceptable acids, have valuable antiinflammatory and analgesic properties.

According to the present invention, therefore, there are provided, as new compounds, piperazine derivatives of the above formula and their physiologically acceptable acid

addition salts. The present invention also comprises pharmaceutical compositions comprising one or more of the compounds according to the invention and an inert, physiologically acceptable carrier.

The present invention further comprises a process for the preparation of the novel piperazine derivatives, which comprises con-densing a substituted piperazine of the formula

in which R2 has the above-stated meaning, with a 1,2,4 - oxadiazole of the formula

in which R_1 and n have the above-stated 45 meanings.

The 1,2,4 - oxadiazole starting materials for this process can be prepared by the process described by G Palazzo et al J. Med. Pharm. Chem., 4, No. 2, (1961). In the case in which n is 2, it is preferred to use a variant of the above-described process in which the starting material is not a 1,2,4oxadiazole but the corresponding acrylylamidoxime of the formula

$$\begin{array}{c|c} \operatorname{CH}_2 = \operatorname{CH} - \operatorname{C} - \operatorname{O} \\ \parallel & \parallel \\ \operatorname{O} & \operatorname{N} \\ & \\ \operatorname{R}_1 \end{array}$$

in which R₁ has the above-stated meaning, this compound being reacted with the appropriate substituted piperazine in an organic solvent, suitably toluene, at an elevated temperature.

In order that the invention may be more fully understood, the following examples are given by way of illustration only:—

EXAMPLE 1

1 - (2 - Phenyl - 2 - ethoxy) - ethyl - 4 - [3 - (3,4,5 - trimethoxyphenyl) - 1,2,4 - oxadiazolc(5)] - methylpiperazine dihydrochloride.

23.4 g (0.1 Mole) of 1-(2-phenyl-2-ethoxy) - ethylpiperazine were heated for 2 hours under reflux with 28.55 g (0.1 mole) of 3-(3,4,5-trimethoxyphenyl) - 5-chloromethyl - 1,2,4 - oxadiazole (m.p. 91—92°C) in the presence of 8.5 g of NaHCO₃ and 150 ml of n-butanol. After cooling, the NaCl formed was filtered off and the butanol was evaporated in vacuo. The residue was taken up in absolute ethanol, the solution was filtered and acidified with HCl-saturated absolute ethanol. The dihydrochloride crystallised out. After two recrystallisations, the product was obtained as white crystals, m.p. 176°C.

EXAMPLE 2

1 - Phenyl - 4 - {2 - [3 - (4 - fluoro - phenyl) - 1,2,4 - oxadiazole (5)] - ethyl} - piperazine.

35

45

60

65

a) First stage: preparation of acrylyl - 4 - fluoro - phenyl - amidoxime.

110 g of 4 - fluoro - phenyl - amidoxime, 360 ml acetone and 60 g of anhydrous K₂CO₃ were introduced into a 3-necked flask having a mechanical agitator, a thermometer, a CaCl₂ tube and a bromine funnel. The flask was placed in an ice bath and a solution of 70 g of acrylic acid chloride in 80 ml of acetone was introduced into it with agitation and while maintaining the temperature between 5° and 10°C. Upon completion of the addition, the ice bath was removed and agitation was continued at ambient temperature for from 3 to 4 hours. Under these conditions there was partial precipitation of the product and the precipitate was washed with cold water. The remainder of the product was recovered by evaporation of the acetone. The two portions were combined and then washed first with cold 5% aqueous Na₂CO₃ solution, and then with water. Crystallisation in acetone gave the required intermediate product, m.p. 99°—100°C.

b) Second stage: preparation of end product.

10.4 g. (0.05 Mole) of acrylyl-4-fluorophenylamidoxime and 8.1 g of 1-phenylpiperazine were heated under reflux in the presence of 80 ml of toluene in a flask surmounted with a Dean-Stark decanter and an ascending condenser. Upon completion of the reaction as determined by the amount of water collected, which took about 5 to 6 hours, the toluene was evaporated off leaving a residue which crystallised. After two recrystallisations in ethanol, white needles of the end product were obtained, m.p. 101°C

50

55

70

EXAMPLE 3

1 - (4 - Fluoro - phenyl) - 4 - {3 - [3 - phenyl - 1,2,4 - oxadiazole (5)] - propyl} - piperazine.

5

20

22.25 g (0.1 Mole) of 3-phenyl-5-(3-chloro-propyl)-1,2,4 oxadiazole and 18 g (0.1 mole) of 1-(4-fluoro-phenyl)-piperazine were heated under reflux for 10 hours with agitation in the presence of 8.5 g of sodium bicarbonate and 151 ml of n-butanol. The NaCl formed was filtered off and after the solvent had been removed in vacuo, a thick oil was obtained which crystallised slowly. After two recrystallisations in methanol, white crystals of the desired product were obtained, m.p. 67°C.

EXAMPLE 4

3 - (2 - Thienyl) - 5 - {3 - [4 - (4 - fluoro - phenyl) - piperazine] propyl} - 1,2,4 - oxadiazole dihydrochloride.

A. Preparation of 3 - chloro - butyryl - 2 - thienyl amidoxime

0.2 Mole of 2 - thienyl - amidoxime in 200 ml of acetone and 0.1 of anhydrous potassium carbonate were introduced into a 3-nicked flask provided with a mechanical agitator, a thermometer, a CaCl₂ tube and a bromine funnel. The temperature was maintained at around 5°C while 0.22 mole of γ-chlorobutyryl chloride in 50 ml of acetone was added drop by drop. The mixture was agitated at ambient temperature for 2 hours, the precipitate was filtered off, washed first with ether and then with NaHCO₃ - saturated water. The amidoxime product was recrystallised in acetone; m.p. 120°C.

3 - Chloro - butyryl - 2 - furyl - amidoxime, m.p. 130°C. (dec.); 3 - chloro - butyryl - 3 - pyridyl - amidoxime, m.p. 125°C. (dec.); and 3 - chloro - butyryl - 4 - pyridyl - amidoxime, m.p. 130°C. were obtained similarly.

B. Preparation of 3 - (2 - thienyl) - 5 - (3 - chloro - propyl) - 1,2,4 - oxadiazole.

0.15 Mole of the amidoxime product prepared as described under heading A was heated under reflux in 100 ml of toluene in a flask provided with a Dean-Stark decanter and a reflux condenser. Upon completion of the reaction as determined by the quantity of water collected, the toluene was evaporated off and the residue was distilled in vacuo to give the desired 1,2,4 - oxadiazole.

 $b.p._2 = 144$ °C n_D^{22} ° = 1.5670

3 - Chlorobutyryl - 2 - furyl - amidoxime, 3 - chlorobutyryl - 3 - pyridyl - amidoxime, and 3 - chlorobutyryl - 4 - pyridyl - amidoxime were cyclised similarly to obtain the corresponding 1,2,4 - oxadiazoles, which are non-distillable products and are used in the crude state for the condensation reaction with piperazines.

C. Preparation of 3 - (2 - thienyl) - 5 - 69 {3 - [4 - (4 - fluoro - phenyl - piperazine] - propyl } - 1,2,4 - oxadiazole dihydrochloride.

0.1 Mole of the oxadiazole prepared as described above under heading B, 0.1 mole of 4 - (4 - fluoro - phenyl) - piperazine, and 0.11 mole of NaHCO₃ in 150 ml of n-butanol were heated under reflux for 10 hours. The mixture was filtered and the solvent was removed in vacuo. A residue was obtained which crystallised. The product, which was the free base, was recrystallised twice in methanol; m.p. 67°C.

N % calculated : 15.08 N % found : 15.00

The dihydrochloride was prepared conventionally in absolute ethanol plus dry gaseous HCl. Recrystallisation is effected in ethanol, m.p. = 170°C.

HCl calculated : 15.9 85 HCl found : 18.85

All the compounds according to the invention and presented in Table I can be prepared by processes similar to those described. The dihydrochlorides can be prepared by the addition of HCl - saturated ethanol.

Table 1 of the accompanying drawings gives the meanings of the substituents R₁, R₂ and n for a number of compounds according to the invention which have been prepared and lists the melting points of these compounds in their free base and hydrochloride forms.

The toxicity, anti-inflammatory, analgesic activity and other properties of compounds according to the invention have been evaluated by conventional test procedures, namely:

45

a) Acute toxicity: LD 50 per os in mice

— BEHRENS and KARBER'S method
(Arch. Exp. Path. Pharm., 177, 379, 1935);
results expressed in mg/kg.

b) Analgesia:

1. Thermal stimulus: methods of EDDY and LEIMOACH (J. Pharm. Exp. Ther., 107, 385, 1953) and of CHEN (Science, 113, 631, 1951); results expressed in mg/kg (ED 50).

2. Chemical stimulus: methods of KOSTER (Fed. Proc., 18, 412, 1959) and WITKIN (J. Pharm. Exp. Ther., 133, 400, 1961); results (ED 50) expressed in mg/kg.

5 c) Anti - inflammatory activity: WIL-HELMT and DOMENJOZ's method (Arz. Forsch., 1, 151, 1951).

The results given are the planimetric values obtained by using does equal to 10% of the LD 50.

d) General effects: they were investigated for a 5 mg/kg intravenous dose in narcotised dogs:

X=study of the cardiomoderation caused by excitation of the peripheral end of the pneumo-gastric nerve.

A=study of the adrenalinic hypertension.

NA=study of noradrenalinic hypertension.

(values expressed as percentage reductions).

e) Action on central nervous system: This was investigated by study of spontaneous motility using doses equal to 10% of the LD 50.

The results are expressed as follows:

40 All these results, evaluated for the 35 compounds of Table I, are combined and shown in Table II of the accompanying drawings.

WHAT I CLAIM IS:-

1. Piperazine derivatives of the formula

in which R_1 is a phenyl, 4-fluorophenyl, 3,4,5-trimethoxyphenyl, furyl, thienyl, 3-pyridyl or 4-pyridyl group; R_2 is a phenyl, 4-chlorophenyl, 2-fluorophenyl, 4-fluorophenyl, a phenyl-alkoxyethyl group of the formula

(in which R is an alkyl group containing 1 to 4 carbon atoms), or a benzyl group; and n is 1, 2 or 3, and their physiologically acceptable acid addition salts.

2. The compounds of the formula specified in claim 1 herein specifically described.

3. A pharmaceutical composition comprising one or more compounds as claimed in claim 1 or 2 and an inert, physiologically acceptable carrier.

4. A process for the preparation of piperazine derivatives of the formula specified in claim 1, which comprises condensing a substituted piperazine of the formula

in which R₂ has the meaning specified in claim 1, with a 1,2,4-oxadiazole of the

in which R_1 and n have the meanings specified in claim 1.

5. A modification of the process claimed in claim 4 for the preparation of compounds according to claim 1 in which n is 2, in which the substituted piperazine is reacted with an acrylyl-amidoxime of the formula

in which R_1 has the meaning specified in claim 1, in the presence of an organic solvent at an elevated temperature.

- 6. A process for the preparation of piperazine derivatives of the formula specified in claim 1 substantially as herein described in any of Examples 1 to 4.
